List of abbreviations

AVF  Arteriovenous Fistula
AVG  Arteriovenous Graft
CKD  Chronic Kidney Disease
ESKD  End Stage Kidney Disease
HD  Haemodialysis
KHA-CARI  Kidney Health Australia Caring for Australasians with Renal Impairment
KPI  Key Performance Indicator
PD  Peritoneal Dialysis
RRT  Renal Replacement Therapy
RCN  Renal Clinical Network
Since 2011 the Renal Clinical Network (RCN) has developed and implemented indicators to measure the performance of Victoria’s renal services, through the renal key performance indicator (KPI) working group. These indicators aim to drive service improvement and increase efficiency and consistency through transparent comparison of agency performance.

The renal KPI working group includes a range of health professionals focused on improving the care of patients with chronic kidney disease (CKD). The group developed four KPIs related to CKD and dialysis. The RCN renal transplant working group developed another two KPIs related to renal transplantation.

All six KPIs were formally endorsed by the RCN leadership group in 2012 (Appendix 2). Data is collected monthly by Safer Care Victoria (SCV) through a specially designed website portal. Each health service CEO has given formal permission to participate in the data collection and benchmarking program.

In January 2018, the renal KPI working group became part of the broader RCN Insight subcommittee. The current members of the Insight committee are listed in Appendix 1. They come together at the end of each quarter to analyse the data and ensure the indicators are accurate, meaningful and relevant. Each indicator has clear definitions, parameters and targets set. Targets may be changed as performance evolves. This will be assessed by the Insight subcommittee.

SCV oversees the data entry and puts together the quarterly reports. This report is the 22nd edition and reviews data from October 2017 to September 2018.

We want to ensure this report meets the needs of health services and provides a useful basis for renal service evaluation.

If you have any feedback on this report, get in touch:

KPI 1: PROPORTION OF NEW, PLANNED PATIENTS WHO HAVE RECEIVED CKD EDUCATION BEFORE STARTING DIALYSIS

Definition

The percentage of patients that attended a Chronic Kidney Disease (CKD) education session that is documented in their medical record, before commencement of renal replacement therapy (RRT).

Target

80 per cent of new, planned patients who start dialysis have attended a CKD education session.

Exclusions

- Late referrals (patients commencing dialysis within three months of first renal consultation).
- Patients returning to dialysis with a failed transplant.

Results

All confidence intervals used in this document are specified at the 95 per cent level.
KPI 1 - Number of new planned patients to receive CKD education before starting dialysis

State total: New planned patients = 547
Received education = 506

KPI 1 - Percentage of new planned patients to receive CKD education before starting dialysis 2016 - 2018

Target = 80%

Note: Results based upon data for the period Oct 2017 - Sep 2018.

Note: Results showing trend over time: based on 12-month averages for the previous 3 years.
2018 (Oct 17 – Sep 18), 2017 (Oct 16 – Sep 17) and 2016 (Oct 15 – Sep 16)
KPI 2: PROPORTION OF NEW, PLANNED RRT PATIENTS (EXCLUDING PRE-EMPTIVE LIVE DONOR TRANSPLANTS WITHIN 2 WEEKS OF TRANSPLANT) WHO SUCCESSFULLY USE AN ARTERIOVENOUS FISTULA OR GRAFT ACCESS AT FIRST HD TREATMENT

Definition
The percentage of new planned RRT patients that started treatment using an arteriovenous fistula (AVF) or arteriovenous graft (AVG).

Target
70 per cent of new planned dialysis patients use an arteriovenous vascular access at first treatment.

Exclusions
- Late referrals (patients commencing dialysis within three months of first renal consultation).
- Patients with a failed transplant or transferring from peritoneal dialysis (PD).

Results

KPI 2 - Percentage of patients that successfully used an arteriovenous vascular access at first HD treatment

Note: Results based upon data averaged for the period Oct 2017 - Sep 2018.
**Victorian Renal Key Performance Indicators**

**Safer Care Victoria**

**KPI 2 - Number of patients that successfully used an arteriovenous vascular access at first HD treatment**

State total: New planned patients = 334
Vascular access first treatment = 196

**KPI 2 - Percentage of patients that successfully used an arteriovenous vascular access at first HD treatment**

Target = 70%

Note: Results based upon data for the period Oct 2017 - Sep 2018

Note: Results showing trend over time: based on 12-month averages for the previous 3 years.
2018 (Oct 17 – Sep 18), 2017 (Oct 16 – Sep 17) and 2016 (Oct 15 – Sep 16)
KPI 3 PROPORTION OF DIALYSIS PATIENTS WHO ARE DIALYSING AT HOME

Definition

- Incident patients – the percentage of patients who are dialysing at home within six months of starting dialysis (out of total patients who started dialysis in the six months prior)
- Prevalent patients – the overall percentage of patients who are dialysing at home.

Target

(i) Incident patients – 35 per cent of dialysis patients are on home dialysis within six months of starting dialysis

(ii) Prevalent patients – 35 per cent of dialysis patients are on home dialysis.

Exclusions

Patients who are in home training units.

Results

Incidence

KPI 3 - Incidence percentage of home dialysis patients

Target = 35%

Note: Above graph represents the home incidence rate averaged for the 12 months of Oct 2017 - Sep 2018
KPI 3 - Incidence percentage of home dialysis patients

Target = 35%

KPI 3 - Prevalence percentage of home dialysis patients

Target = 35%

Note: Results showing trend over time: based on 12 month averages for the previous 3 years.
2018 (Oct 17 – Sep 18), 2017 (Oct 16 – Sep 17) and 2016 (Oct 15 – Sep 16)

Prevalence

Note: Above graph represents the home prevalence rate averaged for the 12 months of Oct 2017 - Sep 2018
The above graph demonstrates the percentage of all renal replacement therapy options at each hub in the twelve months to Sep 2018.

Note: Results showing trend over time: based on 12 month averages for the previous 3 years.
2018 (Oct 17 – Sep 18), 2017 (Oct 16 – Sep 17) and 2016 (Oct 15 – Sep 16).
KPI 4: PERITONITIS RATES OF EACH HUB SERVICE

Definition
The average number of months between peritonitis episodes.

Target
A maximum of 0.33 peritonitis episodes for every patient year.

Exclusions
Patients who have a catheter in situ but are still pre-dialysis.

Results

Note: Results based upon data average for the period Oct 2017 - Sep 2018

Improved hub performance in this KPI is reflected in a smaller bar in the above graph. If better than the benchmark value of 0.33 peritonitis episodes per patient year the bar is shaded green and reported as “better than target”.

Average number of PD patients in brackets

Above target
Below target
Within target range
The International Society of Peritoneal Dialysis (ISPD) 2016 guidelines recommended the peritonitis rate should be reported as number of episodes per patient-year. This is a change from the peritonitis episodes per month of the previous five reporting years. The ISPD have also recommended 0.5 episodes per year at risk as the minimum guideline for peritonitis incidence. However, as part of a continuous quality improvement program the RCN recommended the target be lowered to 0.33 episodes per year at risk. Note lower results reported for this KPI represent better performance. Currently six hub services are now performing above the benchmark standard (i.e below target) whilst the state average remains below the target range.
**KPI 5: PROPORTION OF NEW LIVE DONOR TRANSPLANTS THAT ARE PRE-EMPTIVE**

**Definition**

The percentage of new live donor transplants that are pre-emptive (in which the patient requires less than two weeks of dialysis).

**Target**

40 per cent of new live donor transplants are pre-emptive.

**Exclusions**

- Patients with failed transplants recommencing RRT.
- Patients having a combined organ transplant.

**Results**

Note: Results based upon data average for the period Oct 2017 – Sep 2018
KPI 5 - Number of live donor transplants that are pre-emptive

State total: Live donor transplants that are pre-emptive = 29
Total live donor transplants = 60

KPI 5 - Percentage of live donor transplants that are pre-emptive

Note: Results based upon data average for the period Oct 2017 – Sep 2018.
The preferred option is to report KPI 5 activity for each hub service. However due to low activity numbers of the smaller transplant centres their data can often appear statistically insignificant and difficult to meaningfully interpret. To alleviate this problem, their activity was aggregated to increase the statistical robustness. These centres, labelled the ‘collaborative’ in this report, comprise Austin, Barwon, St Vincent’s, Eastern and Bendigo Health Services. Western and Northern Health had their activity numbers aggregated with Melbourne Health due to its transplant service arrangement. All other transplanting centres had their activity reported as per normal.

**KPI 5 - Percentage of live donor transplants that are pre-emptive in last 12 months**

Note: Results based on 12-month averages for previous 3 years.
2018 (Oct 17 – Sep 18), 2017 (Oct 16 – Sep 17) and 2016 (Oct 15 – Sep 16)
KPI 6: PROPORTION OF NEW END STAGE KIDNEY DISEASE (ESKD) PATIENTS 65 YEARS OLD AND UNDER WHO HAVE HAD A TRANSPLANT OR ARE ON THE ACTIVE LIST

Definition

The percentage of new ESKD patients 65 years of age and under who have had a transplant or are on the ‘active’ list within:

i. three months of requiring RRT

ii. six months of requiring RRT.

Target

i. 30 per cent of new ESKD patients within three months of requiring RRT

ii. 40 per cent of new ESKD patients within six months of requiring RRT.

Exclusions

- Patients with a failed transplant recommencing RRT
- Patients having a combined organ transplant.

Results

KPI 6 - Percentage of new ESKD patients <=65yo who are transplanted or on an active list

Target = 40% within 6 months (right bar)

Target = 30% within 3 months (left bar)

Activated or transplanted numbers at 3 or 6 months in brackets

Note: Results based upon data averaged for the period Oct 2017 - Sep 2018.
KPI 6 - Number of new ESKD patients <=65yo who are transplanted or on an active list within 3 months

Note: Results based upon data for the period Oct 2017 - Sep 2018

KPI 6 - Number of new ESKD patients <=65yo who are transplanted or on an active list within 6 months

Note: Results based upon data for the period Oct 2017 - Sep 2018
Appendix 1  Insight subcommittee members

Dr Scott Wilson  Alfred Health
Associate Professor Peter Mount  Austin Health
Mr Richard Knight  Barwon Health
Associate Professor Bill Mulley  Monash Health
Dr David Langsford  Northern Health
Ms Nuala Barker  St Vincents Health
Ms Denise Fracchia  Western Health
Mr Gregory Dowling  Safer Care Victoria
Associate Professor Matthew Roberts  Eastern Health
Appendix 2  KPI rationales

KPI 1: PROPORTION OF NEW, PLANNED PATIENTS WHO HAVE RECEIVED CKD EDUCATION BEFORE STARTING DIALYSIS

Definition
- ‘Planned’ is defined as patients referred to a nephrologist within three years but prior to three months before requiring RRT
- CKD education is defined as either attending a CKD session or a one-on-one session with a member of the CKD team (not a nephrologist consultation only). This education session is to be documented in the patient’s medical record
- Numerator: All new, planned patients who have received CKD education before starting dialysis
- Denominator: All new planned patients who have started dialysis
- Exclusions:
  - Late referrals (patients commencing dialysis within three months of first renal consultation)
  - Patients returning to dialysis with a failed transplant

Rationale
The Kidney Health Australia (KHA)-Caring for Australasians with Renal Impairment (KHA-CARI) Guidelines\(^1\) for Acceptance onto Dialysis (2005) support a multidisciplinary approach to pre-dialysis education, noting that patients and their families or carers should receive sufficient information and education regarding the nature of ESKD and the options for the treatment to allow them to make an informed decision about the management of their ESKD (Level III evidence).

Recent literature\(^2,3,4,5,6\) reinforces the potential for timely and appropriate CKD education to support informed decision making and, where elected, facilitate a planned approach to the commencement of dialysis, contributing to:
- improved pre-dialysis care and self-management
- increased rates of permanent access
- reduced need for urgent start dialysis
- increased uptake of home therapies
- improved quality of life and reduced mortality in the first 90 days post dialysis initiation.

Potential reasons for variation between services

- Disparity of patient access to education programs relating to:
  - Inadequate resources – multidisciplinary staff, education materials, training equipment, delivery methods, data management systems and budget restraints
  - Difficulty in attending due to: distance, poor mobility, lack of transport and / or lack of support person
  - Culturally and linguistically diverse patients (interpreter, information translation often required)
- Disparity in patient uptake of education programs due to variation in:
  - Psychosocial acceptance rates, e.g. increased fear or denial
  - Access to or acceptance of support, e.g. social work, psychologist
  - Collaborative relationships in CKD care, e.g. private nephrologist, primary health, Hospital Admission Risk Program
- Disparity in documentation of education provided due to:
  - Variation in internal processes for defining and recording education sessions
  - No standardised definition of ‘appropriate’ CKD education
  - Lack of Level 1 evidence
  - Lack of standardised measure for CKD education
KPI 2: PROPORTION OF NEW, PLANNED RRT PATIENTS (EXCLUDING PRE-EMPTIVE LIVE DONOR TRANSPLANTS WITHIN 2 WEEKS OF TRANSPLANT) WHO SUCCESSFULLY USE AN ARTERIOVENOUS FISTULA OR GRAFT ACCESS AT FIRST HD TREATMENT

Definition
- New HD patients are those who have chronic maintenance HD as the first RRT
- ‘Planned’ is defined as patients referred to a nephrologist within three years but prior to three months before requiring RRT
- Vascular access is defined as either an AVF or AVG
- Successful use of an access is defined as not requiring a temporary access
- Numerator: Number of new planned patients starting HD using an AVF/AVG
- Denominator: Total number of new planned patients starting HD
- Exclusions:
  - Late referrals (patients commencing dialysis within three months of first renal consultation)
  - Patients with a failed transplant or transferring from PD

Rationale
Consideration should be given as to the most appropriate type of vascular access for each individual patient. Current guidelines suggest that the arteriovenous fistula is the preferred choice of vascular access (over central or femoral venous catheters) for patients commencing haemodialysis. When compared to the use of central venous catheters, early access creation (AVF and AVG) is associated with a significantly reduced risk of sepsis and mortality.

Potential reasons for variation between services
- Timing of referral for vascular access creation by nephrologist or the renal team
- Patient reluctance to address impending dialysis necessity or reliance upon pre-emptive transplant
- Public health service waiting list times for vascular surgery
- Differences in clinical follow-up of AVF development post-operatively
- Variation in the number of public / private patients between services
- Variation in skill level and needling techniques between dialysis staff and dialysis units.

8 CARI Guidelines 2011
**KPI 3: PROPORTION OF DIALYSIS PATIENTS WHO ARE DIALYSING AT HOME**

**Definition**
- Patients dialysing at home includes nocturnal and conventional HD; and automated and continuous ambulatory PD
- Incident patients – proportion of patients at six months after starting dialysis
- Prevalent patients – proportion of total dialysis population
- Numerator (incidence): number patients that have attempted at least one month of home dialysis within six months of starting dialysis
- Denominator (incidence): all new planned patients who have started dialysis (in that particular month only) six months previous
- Numerator (prevalence): number of patients on home dialysis
- Denominator (prevalence): all new planned patients who have started dialysis
- Inclusion: patients who have successfully been on home dialysis during any of the six months
- Exclusions: patients who are in home training units.

**Rationale**
Home dialysis maximises independence and assists in addressing current access issues, including transportation for rural patients. Further advantages include quality of life, social and economic benefits. Increasing home dialysis uptake encourages improved outcomes and lower costs and identifying barriers to home therapies will help to increase their use across the state.

**Potential reasons for variation between services**
- Lack of infrastructure for training, support and education
- Travel distances for rural patients, educators, and technicians
- Lack of local support for patients requiring time-dependent assistance
- Lack of adequate water supply or consistent electrical means for rural patients
- Prevalence of rental accommodation / transient living arrangement in a region
KPI 4: PERITONITIS RATES OF EACH HUB SERVICE

Definition

- Peritonitis rate is calculated as the total number of peritonitis episodes experienced by all patients on dialysis (PD) during the reporting month, divided by the total number of months all patients have spent on dialysis (PD), and then multiplied by 12 to be expressed as yearly rate (0.33 episodes per patient year).

- Peritoneal Dialysis peritonitis diagnosed when at least 2 of the following are present
  - Clinical features consistent with peritonitis i.e. abdominal pain and/or cloudy dialysis effluent
  - Dialysis effluent white cell count > 100µL or > 0.1 x 10⁹/L (after a dwell time of at least 2 hours with > 50 per cent polymorphonuclear)
  - Positive dialysis effluent culture

- Relapsing peritonitis: An episode occurring within 4 weeks of peritonitis therapy being completed with the same causative organism (or sterile episode) – to be considered as a single continuous event.

- Recurrent peritonitis: An episode occurring within 4 weeks of peritonitis therapy being completed with a different causative organism – to be considered as a new peritonitis event (see Table 6, ISPD guidelines 2010, vol. 30, no. 4, p. 404)

- Any event beyond 4 weeks after the completion of peritonitis therapy to be considered as a new peritonitis event.

- Numerator: number of peritonitis episodes in all PD patients

- Denominator: total number of patient-months on PD (expressed as a whole number)

- Peritonitis rate expressed as number of episodes per patient year

- Exclusions: patients who have a catheter in situ but are still pre-dialysis.

Rationale

Peritonitis remains the primary reason for PD failure. Peritonitis also contributes to increased hospitalisation and increased mortality.¹⁰ For a PD program to be successful, close attention must be paid to preventing PD-related infections including peritonitis,¹¹ and evaluating the causes when they do occur.

Potential reasons for variation between services

- Patient training techniques and patient’s ability to perform procedure and manage the treatment

- Staff to patient ratios in PD training units and clinics

- Treatment regimens for peritonitis
- Patient demographics, supports, and time already spent on peritoneal dialysis.
KPI 5: PROPORTION OF NEW LIVE DONOR TRANSPLANTS THAT ARE PRE-EMPTIVE

**Definition**
- New patients are those new to ESKD, that is, not those who have previously had a transplant
- Pre-emptive transplant is defined as patients who are transplanted requiring no or under two weeks of dialysis.
- Numerator: total number of pre-emptive new live donor transplants
- Denominator: number of new live donor transplants
- Exclusions:
  - Patients with a failed transplant recommencing RRT
  - Patients having a combined organ transplant

**Rationale**
Kidney transplantation remains the optimal form of renal replacement therapy for ESKD. Live donor (related or unrelated) transplantation currently represents approximately 40 per cent of all transplants and offers excellent patient and transplant outcomes.

Timely live donor transplantation can potentially avoid prolonged periods of dialysis, which carry increased risk of morbidity and significant cost. In many instances, timely live donor transplantation can help patients to avoid dialysis completely. This is referred to as ‘pre-emptive’ transplantation. The quality and efficiency of a live donor program can be measured in part by the proportion of lived donor transplants that are ‘pre-emptive’.

**Potential reasons for variation between services**
There is substantial variation across Victorian services in rates of live donor transplants with some services exceeding national averages and some performing live donor transplants at less than 50 per cent of the national average rate. Variation is potentially explained by timely access to relevant services, appropriate education of patients and potential donors and physician attitudes.
KPI 6: PROPORTION OF NEW ESKD PATIENTS 65 YEARS OLD AND UNDER WHO HAVE HAD A TRANSPLANT OR ARE ON THE ACTIVE LIST

Definition
- New patients are those new to ESKD (not those who have previously had a transplant)
- Requiring RRT is defined as the point at which either transplantation or dialysis is required to sustain life
- Numerator: number patients ≤ 65 years old who have had a transplant or are ‘active’ within three or six months of requiring RRT
- Denominator: number of patients ≤ 65 years old requiring RRT
- Inclusions:
  - Any patient who has been ‘active’ within the three or six months
  - All pre-emptive transplants
- Exclusions:
  - Patients with a failed transplant recommencing RRT
  - Patients having a combined organ transplant

Rationale
For those with ESKD that are medically, surgically and psychologically suitable early transplantation is the best life extending treatment option. Early live donor transplantation or timely listing for deceased donor transplantation is the ideal goal for these suitable individuals. This requires significant planning prior to commencement of dialysis. This KPI therefore serves as a measure of the efficiency of the work-up process and identifies barriers. The 65 years of age group and under has been chosen to more accurately reflect the target dialysis group for transplantation.

There will always be a proportion of patients 65 years and under that are unsuitable for transplantation due to a variety of factors such as obesity, smoking, cardiovascular, psychiatric, non-adherence and malignancy. There is an assumption that the percentage of these unsuitable patients is similar across all health services.

Patients that have either not been assessed for transplantation or not completed the transplant work-up process will also be assessed as failing to meet this KPI.

The reasons for failing to meet this KPI will likely be extremely heterogeneous and reflect a variety of both unit and patient factors. Greater analysis is needed.
Potential reasons for variation between services

- Variation in the referral patterns to nephrology and transplant service
- Differences in the processes used to make final decision regarding suitability.
- Different access to investigations, appointments and referrals to other services (such as imaging, cardiology services, psychiatry)
- Differing physician attitudes regarding suitability factors, for example surgical, medical, smoking status and weight
- Patient demographics, geographic factors and educational factors.

Reducing the variability in any or all these factors will potentially lead to greater efficiency and equity in transplantation.
